P.R. Thomison, Associate Professor, Dept. of Horticulture & Crop Science

Objective

Interest in growing corn in organic cropping systems has been on the rise in recent years. An evaluation of corn hybrids marketed for organic producers was conducted at the Hirzel Sustainable Systems site, a certified organic farm located near Bowling Green in Wood county. The data from this performance test is intended to help organic corn producers select hybrids to grow on their farms.

Background

Location:	Hirzel Sustainable Systems Site	Previous Crop:	Alfalfa
County:	Wood	Planting Date:	5/28/04
Nearest Town:	Bowling Green	Planting Rate:	23,000 seeds/A
Soil Type:	Hoytville Clay Loam	Row Width:	30-inch
Tillage:	Conventional	Harvest Date:	11/22/04

Method

Plots were planted in a randomized complete block design with four reps. Four row plots were planted, with the center two rows harvested. Plots were 25 feet in length. No fertilizers or pesticides were applied to the site. Weed control was provided by mechanical cultivation. Notes and measurements were taken on the following: yield (bushels per acre at 15.5% moisture), harvest moisture, stalk lodging, final stand, percent emergence, test weight and silk day (the Julian day of the year in which 50% of the plants were silked).

Results

Performance data for the 2004 Organic Corn Performance Test.

Summary

Growing conditions were generally favorable for corn production at the site, however, excessive rainfall in May delayed planting. Grain yields ranged from 74.6 to 123.6 bushels/acre; stalk lodging from 9-56%; and grain moisture at harvest from 18.8-28.5%. The relative maturity of the hybrids entered ranged from 81 to 116 days.
